Lab: Modeling Protein Synthesis - Wildcat A

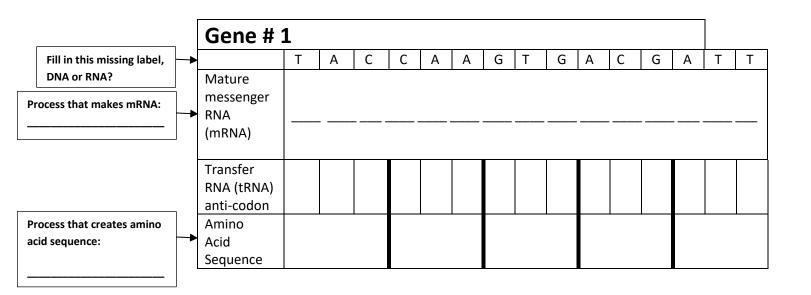

Introduction: Today our classroom is made up of different eukaryotic cells found within a new species discovered in League City. It was named *Clearcreekus wildcatorum*. This cell, like ALL cells, is always busy synthesizing various proteins. You will be working with a partner to simulate the process that builds these proteins for your cell. This process is called **protein synthesis**. Protein synthesis involves two steps: transcription and translation.

- 1. Transcription: A small portion of DNA called a gene unzips to expose the nitrogen bases. The DNA strand is used as a template to make a messenger RNA (mRNA). mRNA was created with the enzyme RNA polymerase. The pre-mRNA is then edited within the nucleus. The introns are removed and the exons are joined together to create a mature mRNA. mRNA leaves the nucleus through a nuclear pore and enters the cytoplasm.
- 2. Translation: In the cytoplasm, a ribosome attaches to the mRNA. Every 3 bases on the mRNA are a codon which codes for a specific amino acid. Another RNA molecule known as transfer RNA (tRNA) brings an amino acid to the mRNA. The tRNA has three bases, known as an anti-codon, that form a temporary bond with a codon on the mRNA. A specific amino acid is attached to a tRNA with a specific anti-codon. As the tRNA anti-codon attaches to the mRNA codon, amino acids are linked together to build a polypeptide chain. The chain of amino acids will continue to be made until

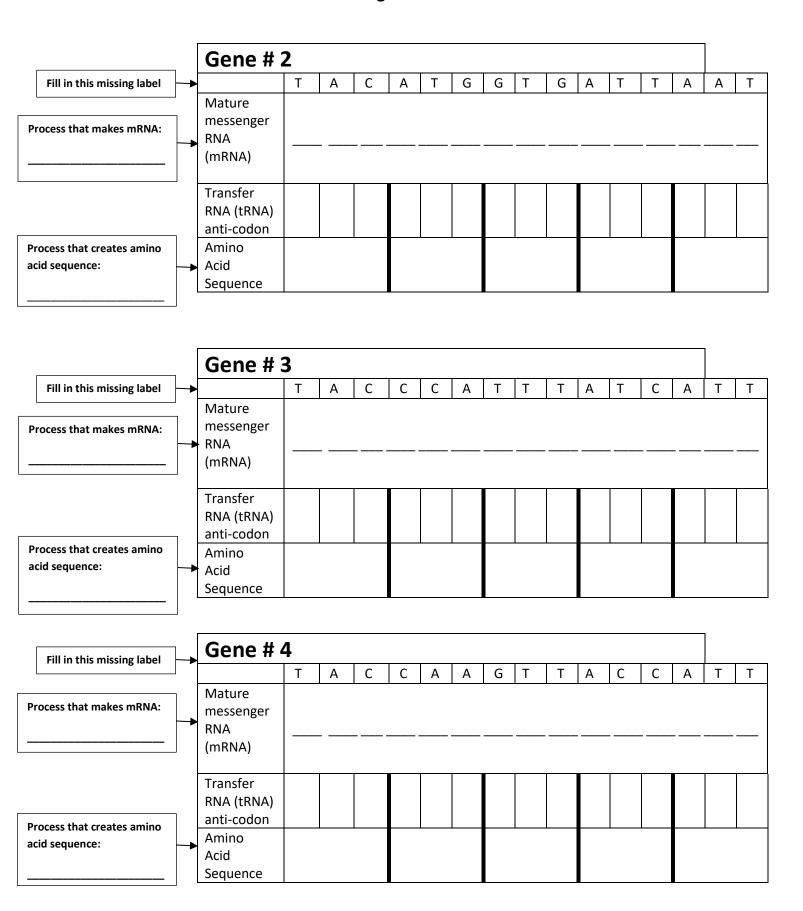

a stop signal is received. This polypeptide chain is released and folds itself up. A **protein** is now formed.

Analysis

- 1. Use the tables below to determine the traits of your wildcat.
- 2. All amino acids have 3 letter abbreviations. USUALLY this is the first three letters of the amino acid

Amino Acid Sequence	Met-Gly-Lys-Stop
Trait	Long fur on ears, body and tail

Amino Acid Sequence	Met-Val-His-Cys-Stop
Trait	Long nose/snout

Amino Acid Sequence	Met-Tyr-His-Stop
Trait	Long tail with dark stripes

Amino Acid Sequence	Met-Gly-Lys-Cys-Stop
Trait	Long whiskers

Amino Acid Sequence	Met-Met-His-Glu-Stop
Trait	Dark stripes and spots on body

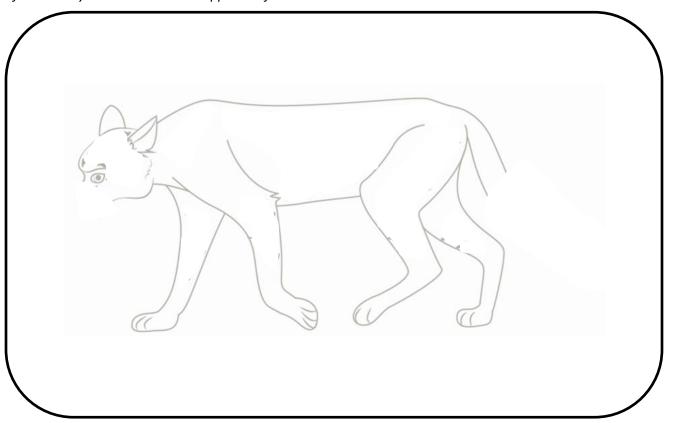

Amino Acid Sequence	Met-Val-Glu-Try-Stop
Trait	Thick sharp claws

Identify the traits of your specific Clearcreekus wildcatorum.

Record the traits in the space provided.

Gene	1	2	3	4
Trait				

Draw your Clearcreekus wildcatorum. Draw over the background image and add your traits. If you do not get one of the traits you should draw the opposite of that trait.

I had Wildcat A, B, C (circle one)

Name	your Wildcat!
